

The Problem

Often in school, trying to take notes during a teacher's lecture may prove challenging. Trying to write something and listen to what the teacher says next can cause students to mishear or completely miss potentially important bits of information. At work, pieces of vital information may be missed during the meeting which needed to be recorded. Even in casual conversations you may hear a piece of info or something that catches your ear but not be able to immediately write it down.

The solution:

This app will run in the background so even at unexpected moments you can use it, voice or prompt activated it will constantly record the audio in your area and under a specific prompt will record all audio for any desired time up to 3 hours. The AI will also have a caption feature, so you may still understand important info even when audio listening may not be the most convenient.

Challenges:

- Deciding what AI Api to use that can viably use the audio around you
- Deciding and designing the interface for the AI
- How the AI gives back the recorded audio
- Deleting the unused recording of the 3-hour recording
