

What is Generative AI and how can it be used in the Microsoft workspace?

In my report paper, I will talk about what generative AI is, how it works, and how it is applied and can be applied in the Microsoft workplace.

My Findings:

How do AI models work?

AI Models typically work by being fed massive amounts of data in specific subjects or in just one specific subject and analyzing that data for consistencies and patterns. At any AI's core it specializes in pattern recognition, data processing, and predictive modeling.

What is generative AI?

Generative AI Is a form of AI that designs content related to a given topic based off patterns of that topic in massive amounts of data. This distinction is what differentiates it from other AI models which analyze or categorize data. Generative AI takes reoccurring elements in the dataset and uses them to create new images altogether

The Microsoft workspace

Microsoft 365 is a vast software space with office 365 sitting at its center. Generative AI like Copilot can be used to build the framework of drafts, emails or other documents. Generative AI can also aid the Microsoft workspace by empowering different software to interpret or fill out certain documents for you based on reoccurring patterns. The Microsoft Azure space is the second heart of Microsoft and consists of a gargantuan AI workshop called Microsoft Foundry, consisting of various AI like DeepSeek, Claude,

ChatGPT, Generative AI is used in this Foundry workspace to optimize and safely deploy agents/applications

Challenges:

Some challenges faced were analyzing different AI models and finding similarities. At face value different AI models seem to function in vastly diverse ways and trying to figure out the base of what makes them all tick proved a challenge

Closing:

In summary, AI works by taking in massive amounts of data and analyzing its patterns and consistencies and using that data to complete various tasks which in the case of generative AI creates added content based off those consistencies and patterns. This can be used in the Microsoft workspace via empowering different software within the Microsoft workspace, such as office 365.
